

# Raspberry Guide

## Planting

They prefer a location with slightly acidic soil with a pH around 5.5-6.5, full sun at least 6-8 hours a day and well-drained soil. Dig a hole slightly larger than the plant's root ball.

## Fertilizing

Fertilize once a year before blooms begin to form, typically around early spring before new growth. Use a balanced fertilizer, such as a 10-10-10 fertilizer.

## Pruning/Support Structures

Raspberries need a support to grow upright, such as a trellis system or fencing. Pruning recommendations depend on the type of raspberry variety.

## Pollination

Raspberries are self-pollinating so they do not require another raspberry plant. Raspberries benefit from insect pollinators, such as bees.

For additional varieties of berries we offer, come visit our retail store.
